Decorative and Constructive Elaboration

• Complete reconstruction of the Korca bazaar along the new city-planning architecture and construction criteria, avoids the sliding and displacement that occurred in the past. In the place of the fragile materials will be used a wide variety of stable native materials, rock brick, limestone mortar and metal shop shutters. A great number of other measures and building techniques will be used to achieve this result.

• The construction plan for the rebuilding of the bazaar does not neglect the caring for the elaborate architectural and decorative works. In the buildings one finds diverse architectural elements such as decorative motifs executed in rock, iron and plaster, dressed walls, and around both the floors and shop windows are defined cornices and the peculiar decorative motifs.
