January 2016, a team of three young architects and a designer gathers to organize a constructive workshop for the European Architecture Students Assembly, that will take place during the summer in Nida, Lithuania.

The ambition of this application was to propose a permanent building, integrated into Nida’s landscape and environment, serving local community interests. The team took a great advantage of some of its members experience that participated to the previous editions of EASA in 2014, Bulgaria, and 2015 in Malta.

EASA (European Architecture Students Assembly) is a European network of young architects that exists since 1981. For more than 35 years, it has allowed architecture students and professionals, and people from other disciplines, to study today’s architecture context, cities and technologies.

It is an experimentation platform, to exchange ideas, knowledges, cultures. A community of five hundred European architecture students gathers once a year during the summer, in a different country every time.

During two weeks, the assembly is organized by students, for students, and works on a non-profit and cooperative basis.

The participants can thus choose between 35 different workshops, that range from pure construction to pure theory: scenography, sculpture, photography, animation...

It is a way of trying new disciplines and techniques, and encourage the dialogue between various architectural cultures.

EASA 2016 took place in Nida, Lithuania, from Aug. 1st till Aug. 16th.
