ASSESSMENT

The STAG BEETLE information point was set up at the forest edge of the Nature Park Tivoli, Rožnik and Šišenski hrib, complementing the park’s features and highlighting the natural heritage of the city forest. The purpose of the micro-location arrangement of cut logs at the entrance of the Nature park was to provide the living space for the protected stag beetle.

It includes a didactic interpretation about oak trees through the comparison of their developmental phases with significant events in the local environment. The uniquely designed benches and the beetle sculpture are a good example of reviving withered oaks in this area.

The STAG BEETLE information point is being visited by local people, children from schools and kindergartens and many tourists.

The whole project was a successful and nice cooperation between the client (City of Ljubljana), designer and contractor (Studio DREVO), Slovenian Forestry Institute and Institute of the Republic of Slovenia for Nature Conservation.

The STAG BEETLE information point is the first of the planned educational points in the Nature park, which will inform the visitors of various protected species and their importance for the environment.
