Built on the former industrial site of Esch-sur-Alzette, the campus of the University of Luxembourg Faculty of Sciences is laid out over the remains of the old steelworks, dominated by its blast furnaces. In response to the monumentality of their scale, the density of the campus and the requirements of its program, the site is envisaged three-dimensionally.

Three usable structures are thus strategically positioned in order to provide public spaces on the upper floors, whose height is the same as the concrete platform of blast furnaces, raised to 12 m. By their orientation, placement and their power relations, these public aedicules organize activities and flows across the campus. Their location at the edge of the site complete the master plan by framing the entrances and offering an overall grasp of the territory as a built whole in which different types of transparencies intrude.
