In terms of landscape and amenities, our project aims at respecting the original mineral design of the plaza, while reinventing it: hard granite stone pavement and engraved limestone facades. All materials to be exploited on site are taken from the city's recycling streams.

A frame of granite blocks was arranged, offering a visual unit. On some of these blocks, wooden elements were designed to suggest and experiment different uses and possibilities, before making the design permanent.

The two weeks long construction workshop, took place directly on site, making it accessible to the users to follow and discuss the daily evolution of the space. The construction time was punctuated by symbolic, educational and friendly events.
