TAKSİM SQUARE

It was conceived that the ground floors of the buildings facing the square would turn into street cafes, and different pavement materials mark the boundaries of existing dining areas. The pavement style and materials in the square and the environs were reevaluated, by prioritizing durability and aesthetics. Reinforced concrete (50x100 cm., shades of gray and green) was chosen as the pavement material.

By re-arranging the subway exits leading to the square and the newly-implemented underground traffic, we tried to embrace a similar architectural language. Different materials were used, walls were rehabilitated and glass separators were used around them.
