The square has always served as one of the links of the Boulevard Ring. Wide sidewalks with safe pedestrian crossings were designed to be placed along the roadway to improve pedestrian accessibility.

The outdoor exposition determines in detail the important element of historical urban planning. Structural elements of the previous project of a parking lot have been preserved under layers of new construction work serving as a contemporary cultural layer.

A flat empty space at the foot of the amphitheater serves as an area for children’s activities, as well as a meeting point and setting for local events.

The planning structure of the amphitheater was designed in such a way for the seating to create a sense of intimacy.

Aiming to organize a barrier-free environment, the amphitheater was divided by a low-angle ramp with a convenient slope for both low-mobility people and strollers.

Several large trees planted at the amphitheater will allow people to take shelter from the sun during hot summer days. In windy weather, the structure of the amphitheater will also provide shelter. Seats are lined with wood, making them comfortable to sit on in cold weather.
