

# K254 REQUALIFICATION OF THE 24 DE JULHO AVENEU AND SANTOS SQUARE # 02

## A SQUARE IN EACH NEIGHBOURHOOD

### AIM OF INTERVENTION

The Intervention main objectives were:

- Return the Avenue to the Community, significantly increasing the walking and staying pedestrian areas with a significant tree cover;
- Re-create the "Boulevard";
- Implement the network of cycle lanes in continuity with the one that were already designed for the city;
- Increase the planted green area by reducing the number of currently

oversized road lanes;

- Improve, increase and make more secure pedestrian connections to public transport equipment (train station and interface with buses and trams)

### DESCRIPTION OF INTERVENTION

The objectives of the Intervention are thus formalized:

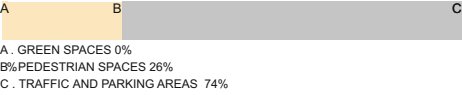

- To cancel the use of the separator in the South with the "bus" strip, making it a continuous flowerbed. Through this it can avoid the crossing of the crosswalks that

dangerously existed up till now, and greatly improve the development of the existing Jacarandas;

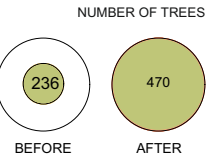

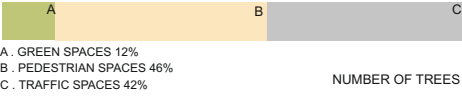

- Increase the central separator to 4,50m, at the expense of the cancellation of one lane, allowing a duplication of the existing Fraxinus line, forming a continuous green "corridor";

- Increase the north sidewalk, occupying the current parking area and side road. In this new boulevard, with the width of 11.50m, plus the bicycle lane, we propose a double row of Ulmus;
