This symmetrical section of a pacified street is a civic axis with a single pedestrian road and pavement platform on the landward and seaward sides, to better define the area for vehicles requiring access to the street and its effective emptying.

The section is a two-lane road; one for traffic and the other for services on the seaward side, and a bicycle lane on the landward side, in a central position in the 20-metre-wide street. This gives a symmetrical section with a 5.45 m landward pavement, a central 9.10 m carriageway and a seaward pavement 5.45 m wide. The alignment elements on the pavements are street lamps and trees. Lamps at two heights, one to illuminate the road and the other the pavement, enhance the street’s symmetry.
