

A complex system of motion sensors recognizes spaces that have been taken up, generating interplay of lights that interact with people and provide the strictly necessary illumination. This, combined with the use of LED lighting, provides considerable energy savings.

#### WORTH: A SPACE FOR FREEDOM

The completion of the first phase of the project achieved the reuse of the square space focusing on the needs of the town citizens at the time – relocation of the main street and a better use of the maximum available central space. A new attractor point of the Visp Valley has been developed, thus improving the tourism of the area as well as creating a meeting point while generating an economic revival of the area and the local wood companies.

However, this is only the first part of an even more important challenge, as the next phase seeks to create more public spaces for ski, promenades and sightseeing, and in between, a small invisible hotel, as a subtle inhabited forest that merges with the genius loci of Bürchen, taking the current landscape as an essential guide.
