

As already mentioned above a central paved area that is degraded at the edges, tiles 1,5x1,5m set. They have an Arabic imprint because they contain a relief taken from a mosaic of this culture in Andalusia.

General view.

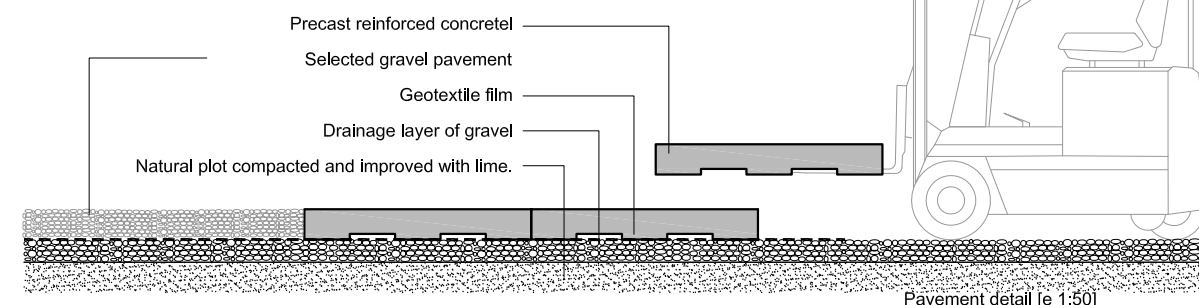

One of the biggest problems the hard places like this, and even more in the latitudes in which we find excessive sun exposure is the same. Although in this case it is unfeasible planting trees in the center of the square due to incompatibility with the archaeological remains of the subsoil. As far as possible trees are planted on the perimeter, as it is where finding sites is less probable.

To address this issue raises a metal sheaths at the intersections of the grid of 6x6m fixed to concrete pavement with a lid to avoid missteps. Occasionally, some posts may be arranged within those pods to install awnings provide shadow and this square. The possibility of such permits shadow when needed and avoid having too many elements that interrupt the view of stretches of wall and defensive towers.

A key issue in the intervention is the ability of the proposal to be reversible. Thinking about it further provides the possibility that, once removed the tiles and carried out the excavation work to proceed, he had the option to return to the paved state without excessive cost. Thus the pieces are of such dimensions that need not be taken with any fixing and can be prepared and removed by a forklift.

On the current field suitably packed and enhanced with a layer of lime bowling about 20cm thick to serve as drainage is provided.

Night vision.
